COLLEGE OF SCIENCE AND TECHNOLOGY

GAKO CAMPUS

COMPUTER ENGINEERING LEVEL III

MODULE: MOBILE APPLICATION

Reg^{no} : 223026680

Name: Aimable SEMUHUNGU

ASSIGNMENT: Lab 4-Comsuming APIs in flutter

1. Dependencies used and why

I used the http package because it helps the flutter app communicate with the API. it allows sending GET, POST, PUT, and DELET requests to retrieve and send data.

I also used flutter material widgets to build the user interface

2. Handling API exceptions

> API exceptions can be handled using try-catch blocks.

if there is a network error, the app can show an error message.

if the response is invalid, we can check the status code and handle errors properly.

Example: if status code is not 200, we display an error message to the user.

3. Future widget

A future is used to handle asynchronous operations like fetching data from an API.

in this app, FutureBuilder is used to display data when it is loaded the UI shows a loading indicator while ~~the~~ waiting, and displays posts when data is available.

The part of UI that depends on future is the list of posts, which is built using FutureBuilder.

Posts Manager Mobile Application - Screenshots

1. Home Screen

This screenshot displays all posts fetched from the API.

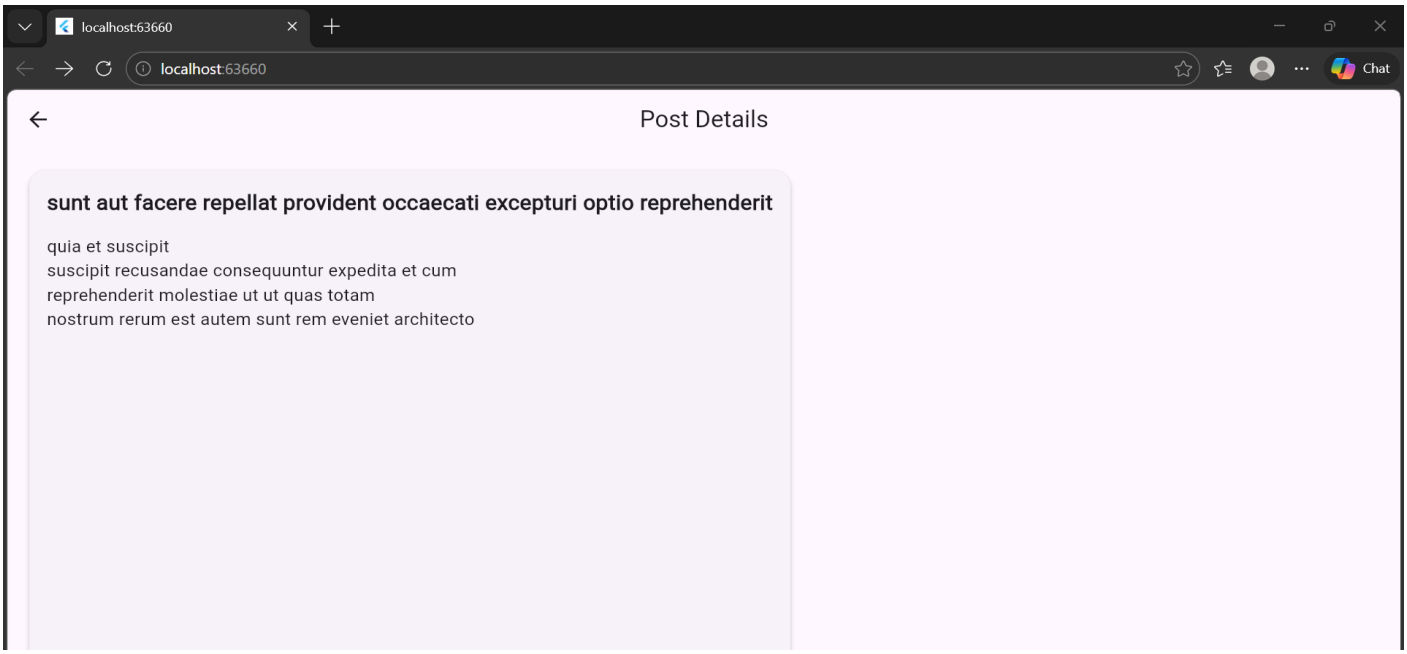
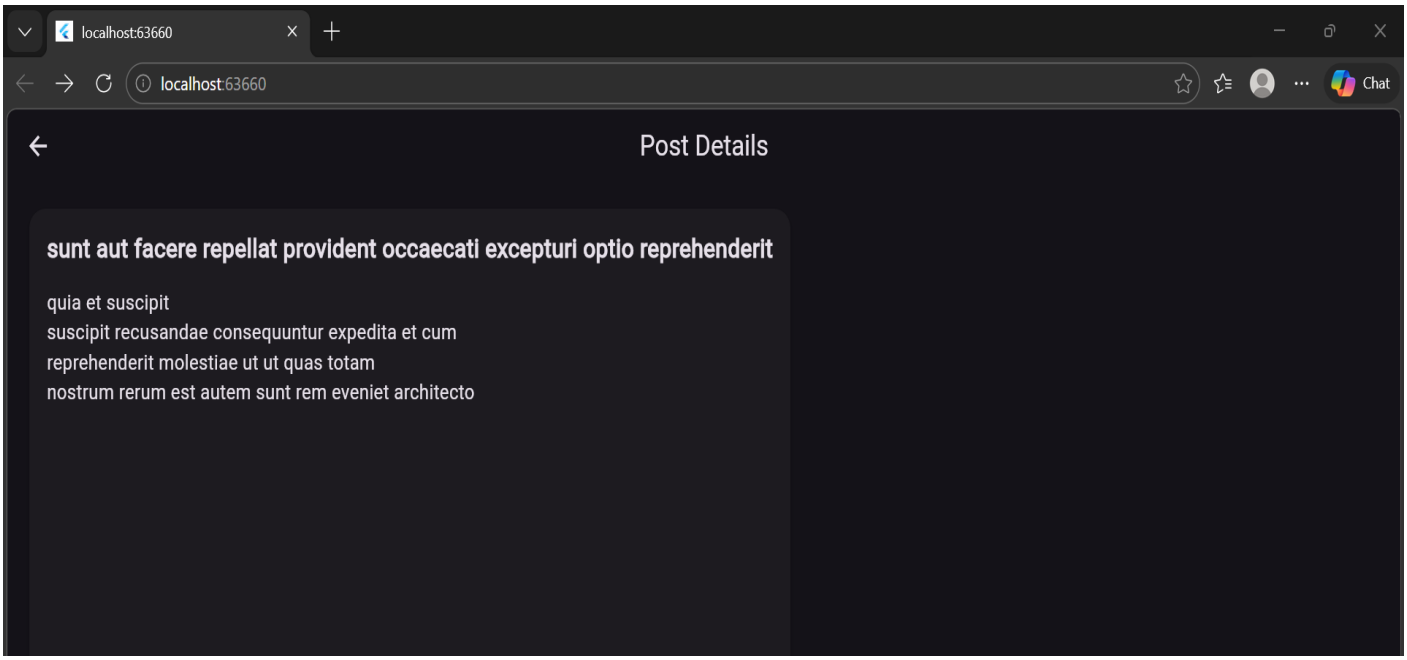
2. Post Details

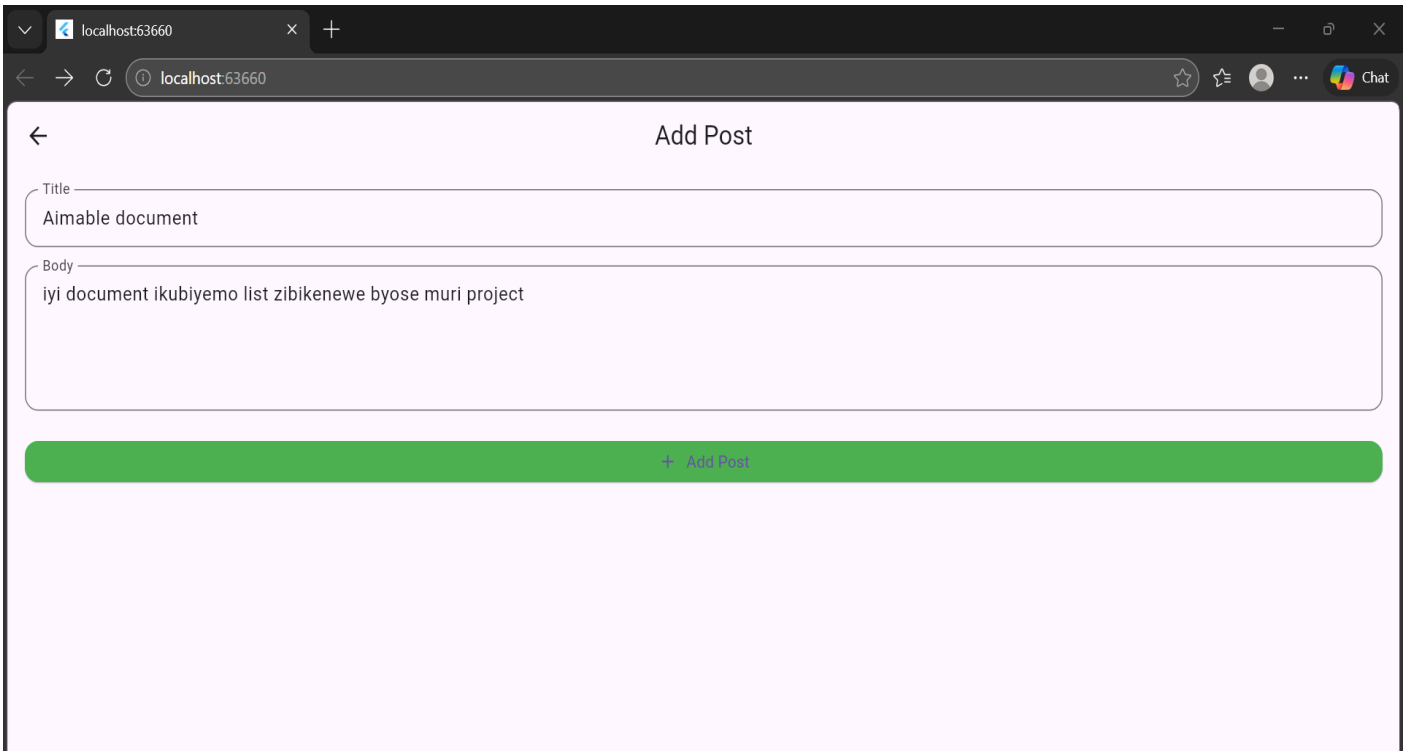
This screenshot Shows the full details of a selected post.

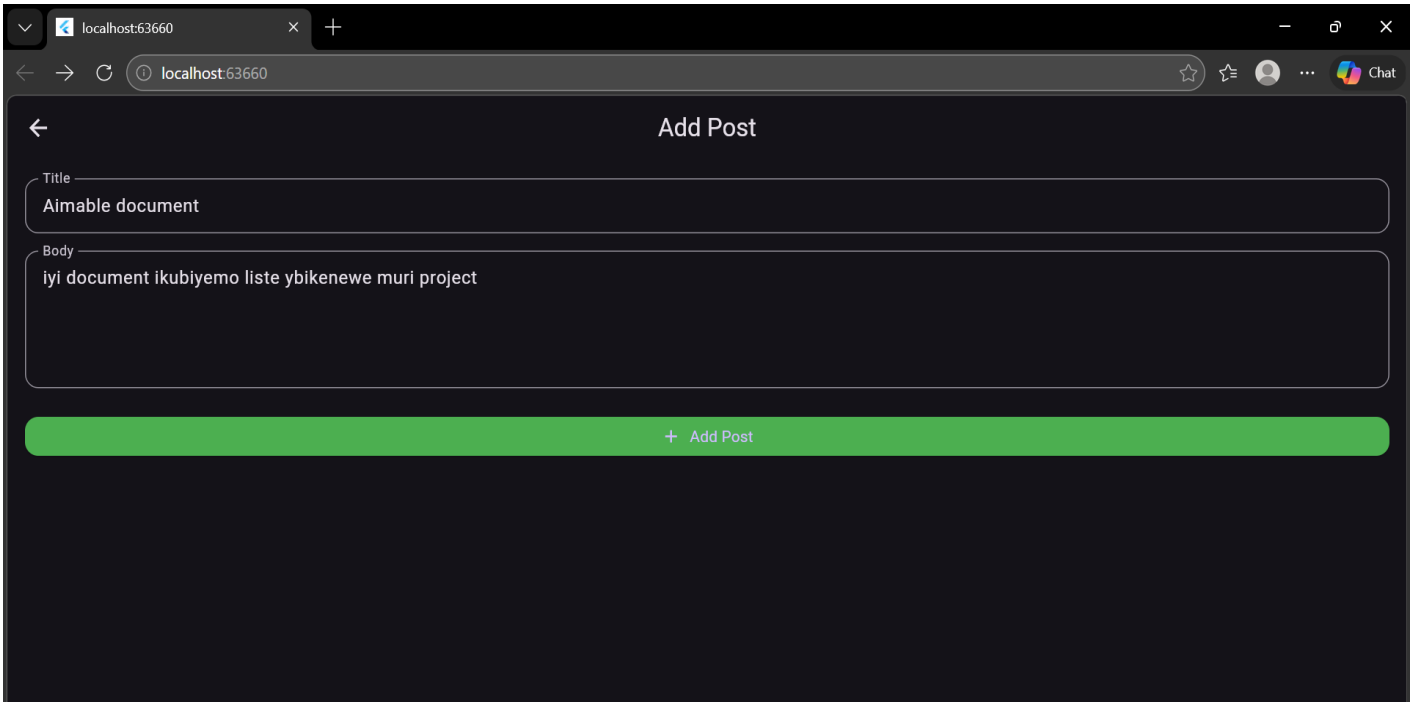




3. Add Post

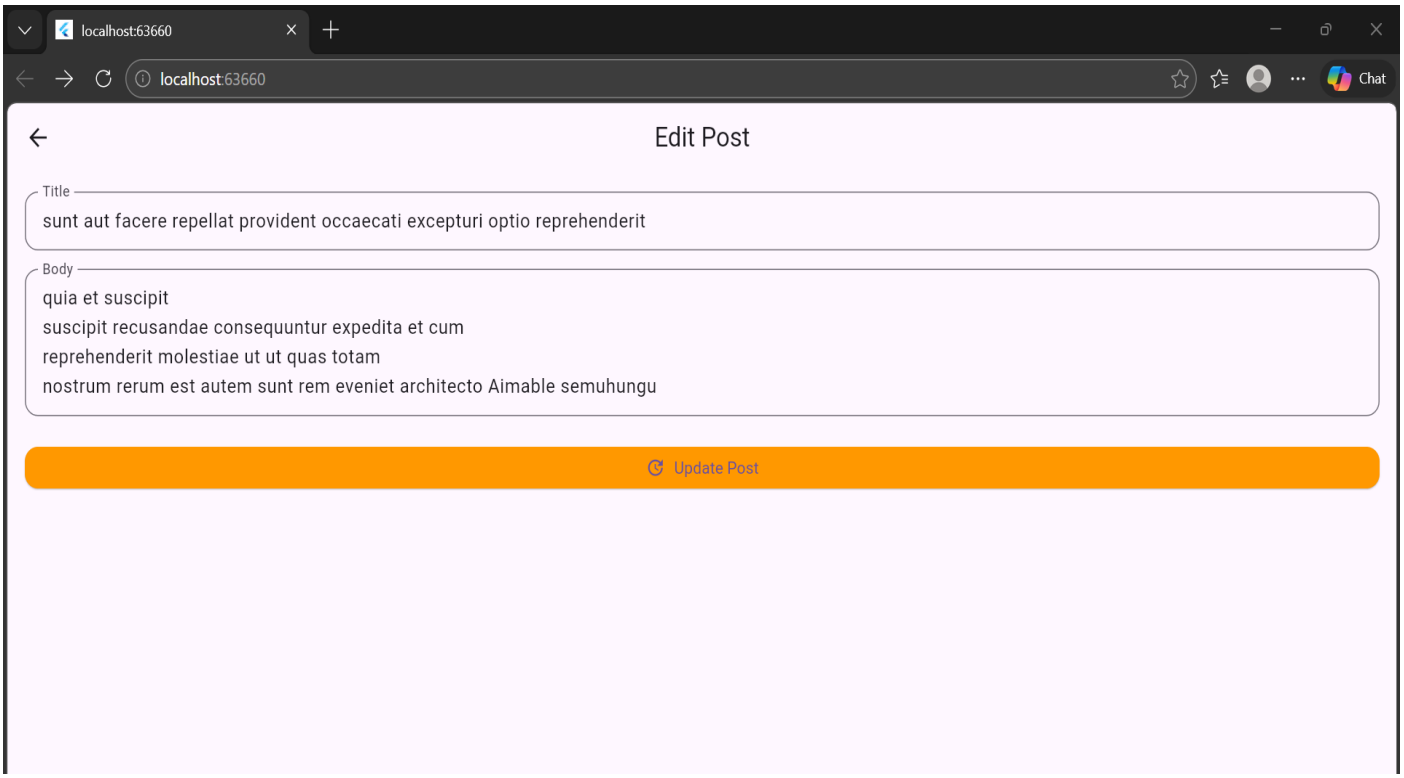
This screenshot shows that the user can create a new post.

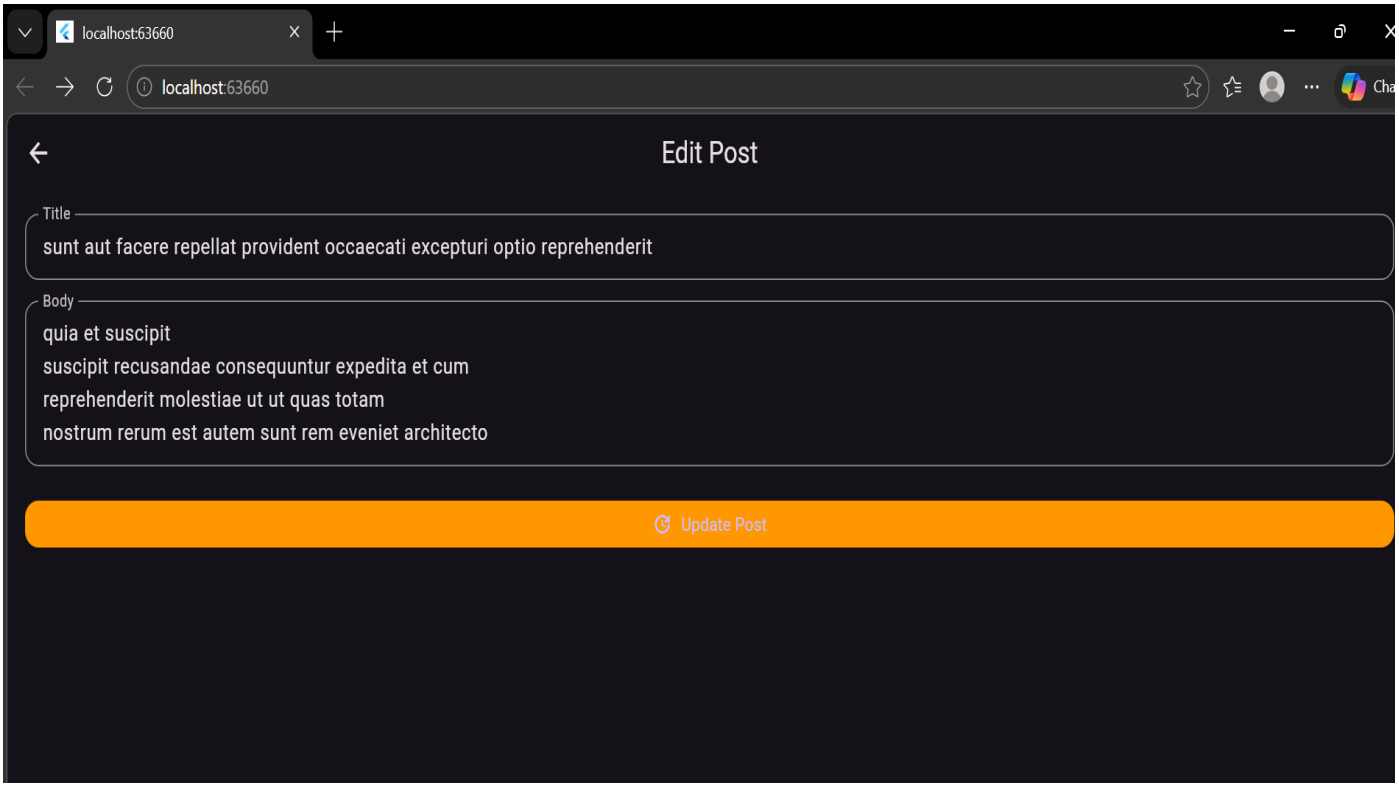




4. Edit Post

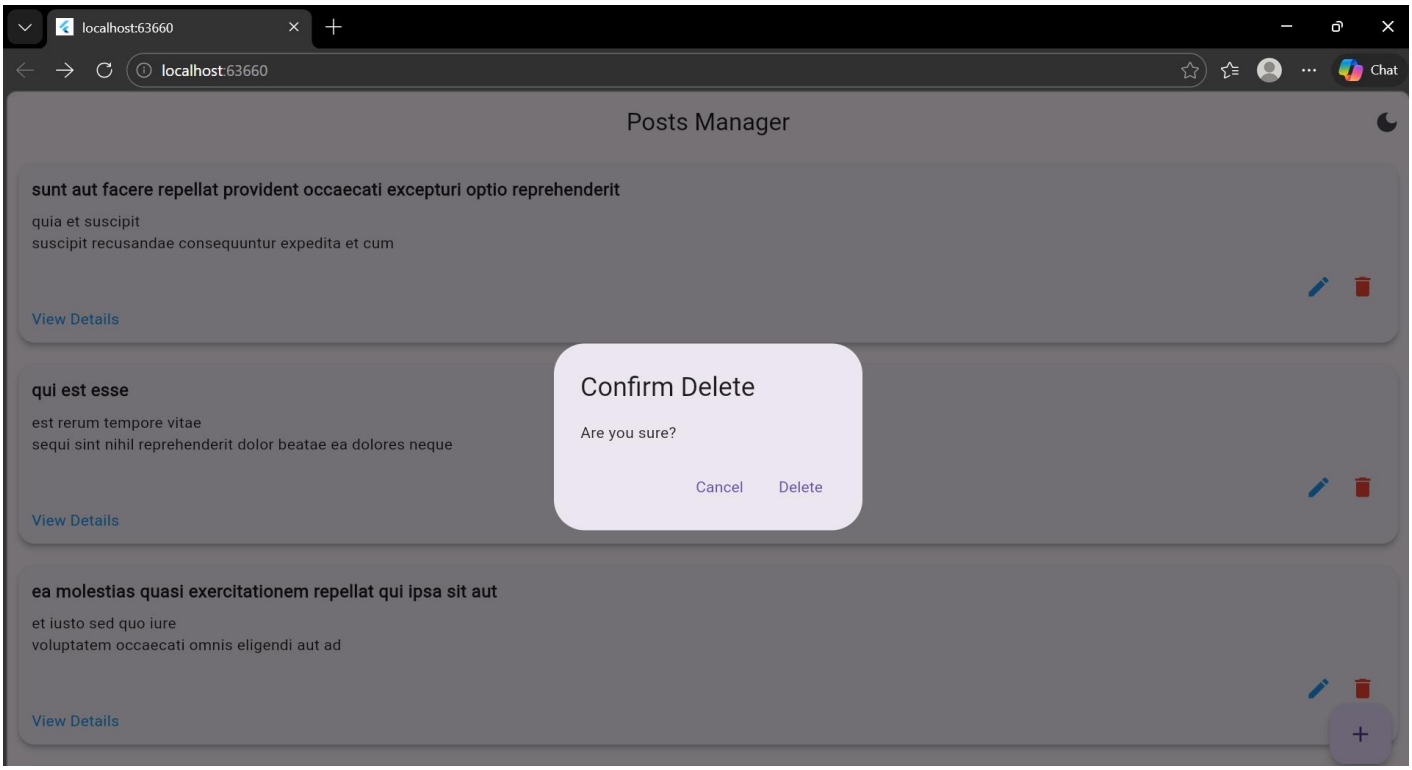
This screenshot shows that the user can update an existing post.

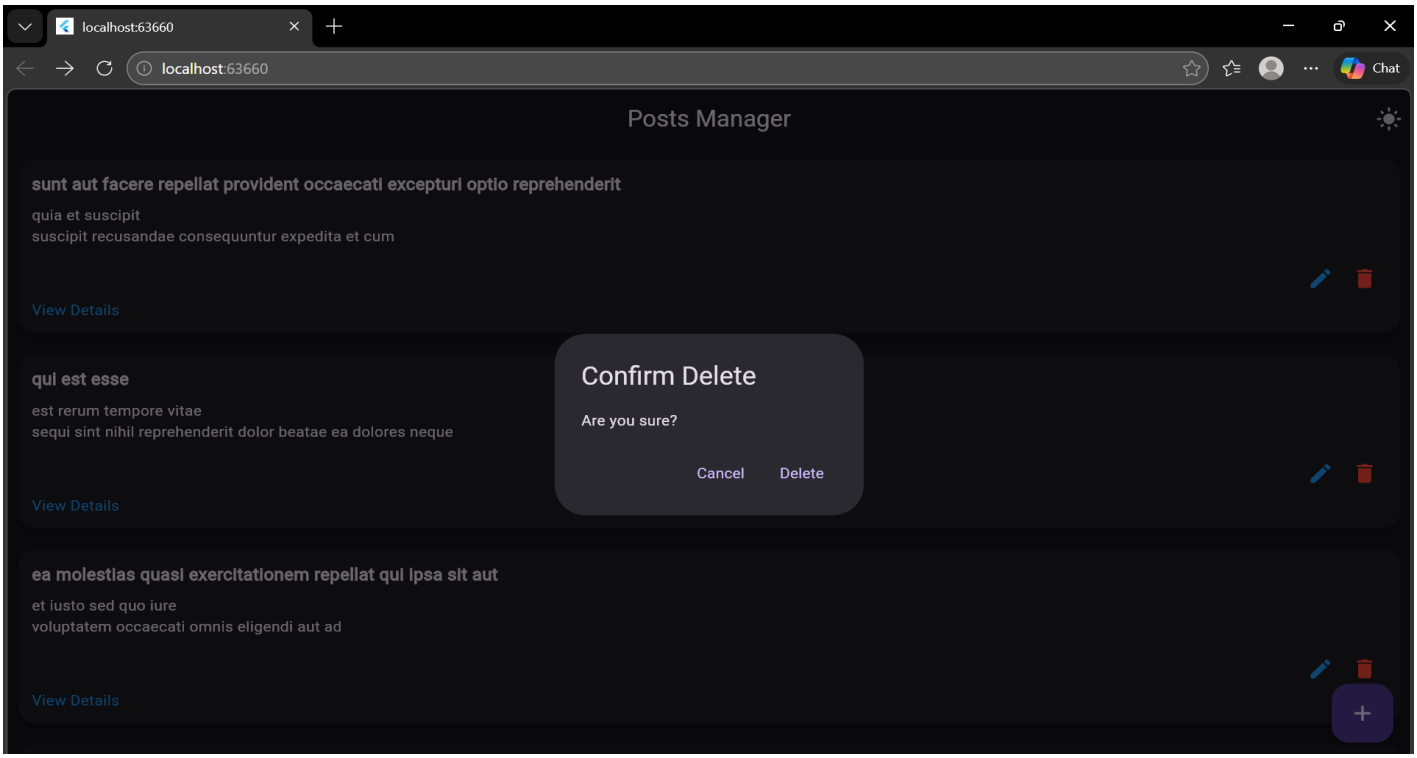




5. Delete Confirmation

This screenshot shows that the system asks the user to confirm before deleting a post.





6. Dark Mode

Allows switching between light and dark themes.
